INTRO

Organic and sustainable farming was designed to introduce more natural farming practices to reduce the impact on our environment

Our association provides reliable certification to develop and sustain quality soil and attempts to exclude the use of any pesticides and chemical inputs in the food and farming industry

Our vision also seeks to place significant emphasis on the wellbeing of livestock, the consumer and land care

Typically organic farming practices present superior soil quality and health, reduced soil erosion, higher nutritional value in our foods, better tasting foods, the reduced health issues connected with the use of chemical pesticides and fertilizer sprays, a higher premium for organic foods sold in the marketplace, increased biodiversity and better health and wellbeing for all

When chemical inputs, pesticides, fungicides, antibiotics, hormones, insecticides and herbicides were first introduced to the farming industry, we reveled in our achievements. We believed we had developed a safe and secure way to produce higher yields of food and with reduced human labor

As our soils, which we rely so much upon, now have become barren, unproductive and practically infertile, we are all confronted with the frightening reality of how chemical farming methods have adversely impacted our environment, our lifestyles, our health, and that these practices should not, and cannot continue indefinitely

Through the high yield chemical practices of conventional farming we have also sadly lost touch with growing our own food at home. Years ago it was not uncommon to have a backyard garden, and now we rely almost solely on large-scale commercial supermarket giants to provide all our produce and foods

We can all make a change and there's still time to transition from conventional farming to a chemical free practice to ensure a sustainable future for all

SO...WHO ARE WE ?

The Chemical Free Farmers Association provides Organic farm certification to farmers who are able to fit the requirements of the association and standards

We are a not-for-profit association run by farmers for farmers

We are actively engaged with the 'Food and Agribusiness Network' (FAN) and also now proudly internationally recognised by 'IFOAM Organics'

We provide our services at the lowest prices possible, ensure minimal procedural complexities and least interruptions to our clients farming operations

Our aim is to increase the credibility and marketability of our clients produce through our reliable certification. We also aim to protect the consumer: through our regular testing we ensure they are getting what they pay for...clean and chemical free food!

Become a member today and help to advocate genuine health and ecological food production in Australia

OUR SERVICES OUR EDGE

Reliable accreditation sends a clear message. It demonstrates our certification and independent inspection body can be counted on to perform our duties in an authoritative and unbiased way. Third party accreditation is recognised around the world as the highest and most credible type of certification, it shows that you have been approved by an independent, professional third party that operates with maximum integrity.

We provide affordable and reliable organic farm certification

We use an independent auditor to conduct regular testing for 120 different chemicals and 8 heavy metals

We provide discounts for organic fertilisers and related farming inputs and support farmers markets and co-operatives

Membership fees do not vary based on our clients business income

Members can access the association's education hub featuring workshops and accredited courses
